Title : Dell PowerStore Operate 2023 Exam

Version : DEMO

1.A site is selecting a PowerStore deployment mode. The same appliance must serve external block hosts and SMB clients. Running application VMs directly on the appliance is not required.
Which deployment mode meets these requirements?
A. PowerStore X with an external vCenter server
B. PowerStore X with AppsON
C. PowerStore T in block-optimized mode
D. PowerStore T in unified mode
Answer: D
Explanation:
The requirement combines external block access with external file access. The 3.0-era deployment table gives both capabilities to PowerStore T in unified mode.

2.A cluster has three PowerStore T appliances. An administrator expects one busy volume to use all three appliances concurrently merely because they belong to the same cluster.
Which statement corrects that expectation?
A. A single volume is serviced by one appliance at a time.
B. Every volume is serviced only by the cluster primary appliance.
C. A volume is striped across every appliance when the cluster is created.
D. Clustering pools management functions but cannot aggregate appliance performance.
Answer: A
Explanation:
The placement of an individual volume remains at one appliance at a given time.

3.An LDAP user can authenticate against the directory, and PowerStore reports a successful directory connection. The user has no PowerStore LDAP user or group mapping and cannot log in to PowerStore Manager.
Which action addresses the missing authorization configuration?
A. Reset the directory password in PowerStore Manager.
B. Add the LDAP user or group to PowerStore and map it to a role.
C. Correct the LDAP bind account's credentials.
D. Correct the directory User Search Settings so the user can be found.
Answer: B
Explanation:
Directory authentication verifies identity; PowerStore still needs a role to authorize management access. The security guide states that login fails when no role can be assigned, even if LDAP authentication succeeds.

4.A team member must create local management users and reset other users' passwords. The organization wants the built-in role intended for security administration rather than granting general Administrator privileges.
Which role fits?
A. Storage Administrator
B. VM Administrator
C. Storage Operator

D. Security Administrator

Answer: D

Explanation:

The security guide permits Administrator and Security Administrator to create users and reset another user's password. The stated requirement specifically selects the security-administration role without granting general Administrator privileges.

5.A PowerStore user has only the Storage Operator role.

Which three file-related tasks are permitted by the 3.0-era role matrix? (Choose three)

A. Modify a file tree quota.

B. Restore a file system from a snapshot.

C. Create a file system on an existing NAS server.

D. Join an SMB server to a domain.

E. Create a new NAS server.

F. Create a file interface.

Answer: A, B, C

Explanation:

Storage Operator can manage file systems on an existing NAS server, manage file tree quotas, and perform the listed file-system snapshot recovery operations.
